ABSTRACT:

The Local AI PDF Assistant is a secure and intelligent web application developed using the MERN Stack and Ollama to help users interact with PDF documents through natural language questions. The system uses the Retrieval-Augmented Generation (RAG) technique to extract text from uploaded PDF files, split the content into smaller chunks, generate vector embeddings, and store them in MongoDB for efficient retrieval. When a user submits a query, the application identifies the most relevant document sections using vector similarity search and provides them as context to the local AI model to generate accurate and meaningful answers. Since the AI model runs locally through Ollama, all document processing remains private without relying on cloud-based AI services, ensuring better security and confidentiality. The application offers a fast, cost-effective, and user-friendly solution for document analysis and knowledge retrieval, making it suitable for students, researchers, educational institutions, businesses, legal firms, and organizations handling confidential documents. It improves information access while maintaining data privacy and reducing operational costs.

PROJECT PLAN FOR (08/08/2026):

- Develop the frontend interface using React.js for the Local AI PDF Assistant.
- Design and implement responsive pages for PDF upload, document management, and the AI chat interface.

PROJECT PLAN FOR (22/08/2026):

- Enhance the DocMind AI frontend using React.js with an improved and responsive user interface.
- Integrate RAG and Ollama-based AI for intelligent PDF document querying and contextual responses.
